

Muhammad Ammar Saleem

Data Analyst | SQL · Tableau · Excel

Karachi, Pakistan (Open to Remote) • +92-310-207-9743 • ma9731501@gmail.com • [LinkedIn](#) • [GitHub](#)

PROFILE

Computer Science (Data Science) student at KSBL with hands-on experience designing relational databases in SQL, building Tableau dashboards connected to real-world datasets, and developing data-driven applications in Java with OOP. Maintains an active GitHub portfolio of industry-focused projects including retail analytics, financial services, healthcare operations, and textile export analysis. Passionate about turning data into decisions. Targeting a professional Data Analyst career — open to remote opportunities.

EDUCATION

Bachelor of Computer Science — Data Science | Expected 2029

Karachi School of Business & Leadership (KSBL) | 2nd Semester, Fall 2025 Batch

TECHNICAL SKILLS

- Data & Analytics: SQL (MySQL · Window Functions · CTEs), Excel — Pivot Tables, Tableau
- Programming: Java · OOP · Python (Fundamentals — Variables, Loops, Functions, OOP in progress)
- Tools & Platforms: Git, GitHub, IntelliJ IDEA, VS Code, JavaFX, Scene Builder, Tableau Public

EXPERIENCE

IT Intern — Indus Hospital

40-hour IT Internship

🔗 [GitHub](#) | [Tableau Dashboard](#)

- Designed a normalized (3NF) MySQL schema modeling end-to-end hospital operations across 11 tables (patients, admissions, doctors, wards, beds, emergency visits, OPD visits, diseases, surgeries, and donations)
- Generated a synthetic dataset (12,000 patients, 18,000 admissions, 6,000 emergency visits) programmatically with Python, and wrote 23 analytical SQL KPI queries using CTEs and window functions
- Built a 4-page executive Tableau dashboard (Executive Overview, Patient Demographics, OPD & Emergency, Surgeries & Donations) from a federated CSV-based data source, after diagnosing and fixing a relationship-model crash caused by two tables mistakenly set up as Unions instead of Relates
- Delivered the project end-to-end — schema design, data generation, SQL analysis, dashboard build, and documentation — as a first-internship project taken from a blank schema to a polished, presentable deliverable

PROJECTS

Fraud Detection Analytics *MySQL · EDA · Data Normalization · Tableau · GitHub*

🔗 [GitHub](#) | [Tableau Dashboard](#)

- Performed full EDA and normalized a 6.36M-row PaySim mobile money dataset into a 3-table relational schema (accounts, transactions, transaction_type), loading via Terminal LOAD DATA LOCAL INFILE after GUI import tools failed at scale
- Wrote fraud detection SQL queries uncovering key patterns: fraud concentrated only in TRANSFER and CASH_OUT transactions, 98% of fraud cases fully drain the sender's account
- Found the dataset's built-in fraud flag caught only 0.2% of actual fraud cases, highlighting the need for better detection rules; built an interactive Tableau dashboard with 5 KPI cards and fraud timeline analysis

PakMart Retail Analytics *MySQL · Window Functions · CTEs · Tableau · GitHub*

🔗 [GitHub](#) | [Tableau Dashboard](#)

- Built a 10-table normalized schema simulating a Pakistani retail chain — 1,000 customers, 7,000 sales rows generated via stored procedure, realistic product categories, store locations, and promotional events tied to Pakistani calendar
- Applied advanced window functions: RANK() for top products per category, LAG() for month-over-month revenue change, DENSE_RANK() for store performance by city

- Designed CTE-based pipelines and multi-table JOINS across 9 business questions covering promotion impact, revenue trends, and top customer analysis
- Built a dark-theme Tableau dashboard (navy #1A1A2E, gold accent) published to Tableau Public

Global Healthcare System Database *MySQL · CTEs · CASE Logic · Tableau · GitHub*

🔗 [GitHub](#) | [Tableau Dashboard](#)

- Built a 19-table, 6,000+ line normalized database covering 190+ countries across 6 domain groups — Core, Health Metrics, Resources, System Factors, Disease & Risk, and Outcomes — sourced from WHO, IHME, World Bank, and OWID
- Designed for advanced SQL querying: multi-table JOINS, CTE-based analysis pipelines, and CASE logic for health outcome classification across income groups and regions
- Covers vaccination coverage, epidemic events, mental health, pandemic response, and inequality index — structured for Tableau dashboarding

Pakistan Financial Services *MySQL · Tableau · GitHub*

🔗 [GitHub](#) | [Tableau Dashboard](#)

- Designed a 9-table normalized schema simulating a Pakistani financial institution — 500 customers, 30 branches across 7 cities
- Built an Executive Tableau Dashboard with 4 views: Revenue by City, Balance by Branch, Employee Performance, and Branch Expansion analysis
- Key insight: Karachi leads in total loan revenue (~340M PKR); Islamabad flagged as top expansion city by customer volume

Pakistan Textile Export Analysis *MySQL · Tableau · GitHub*

🔗 [GitHub](#) | [Tableau Dashboard](#)

- Analyzed real export data from Pakistan Textile Council and Pakistan Bureau of Statistics across 4 tables (2021–2025)
- Visualized impact of COVID-19 and floods on export recovery; identified North America as dominant destination
- Found value-added products consistently outperform traditional textiles — dashboard published to Tableau Public

Payroll Management System *Java · OOP · JavaFX · GitHub (Collaborative)*

🔗 [GitHub](#)

- Collaborative project with abstract Employee hierarchy: Fulltime, Part Time, and Contract subclasses with polymorphic payroll logic
- Implemented using GitHub for version control and team collaboration — SSH authenticated workflow
- Covers payroll calculation, employee management, and OOP design patterns across the full class hierarchy

LANGUAGES

English (Professional Working Proficiency) Urdu (Native)
